

DustCap® *Dust Suppression & Freeze Control*

Safer Surfaces in Agriculture Environments

Agriculture is rooted in soil. When soil dries out, freezes and thaws, it can become a real hazard. Diminished visibility on roads from clouds of dust, slippery surfaces during cold weather, mud and slush when the frozen ground thaws...it all adds up to risks for people, equipment and animals.

In winter and summer alike, Arclin's DustCap® acts as a dust suppressant, significantly reducing the threat of harmful air particles and impaired sight caused when wind and equipment kick up dust on the road.

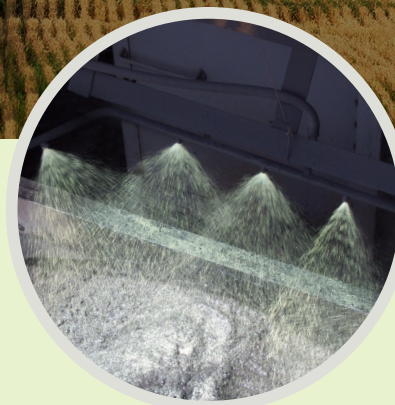

DustCap is also designed to lower the freezing temperature of the ground on farm and ranch access roads. It helps the soil thaw more quickly, offering added protection against the perils of cold winter temperatures.

Sprayable and environmentally friendly, DustCap is water-based, safe and cost-effective — a clean and simple way to control freezing and dust. And our DustCap products are E-Gen®-designated, which means they provide great performance and reduce negative impacts on the environment.

The benefits of Arclin's DustCap Freeze Control & Dust Suppression:

- Lasts longer than other dust and freeze control treatments, so you treat less often and save money
- A sprayable biodegradable liquid, it is environmentally friendly, water-based and cost-effective
- Won't corrode application equipment or vehicles that drive on treated surfaces
- Improves surface integrity with repeated use

Specify

*The Ingredients of **Green®***

Arclin applies its proprietary E-Gen® designation only to its products that are expressly engineered to meet or exceed existing product performance standards and to reduce manufacturing **and** downstream environmental impact.
